PATENT Attorney Docket No. 033370-005

Abstract

A method of synchronizing databases between multiple users in a peer-topeer network is disclosed. The method comprises extracting changes from a source
database of one of the users. Next, the changes are compressed and sent to the other
users in the peer-to-peer network in parallel. Finally, the changes are decompressed
and replicated on the database of each of the other users. In this respect, the
databases of the other users will contain all changes from the source database.
